Outline of the Talk

- Introduction: Cosmology and (algebraic) quantum field theory,
- The set-up: From a massive scalar field to the conformal anomaly,
- Applications: On semiclassical Einstein's equations in cosmology,
- Robustness: On the conformal anomaly for Dirac fields.

- 4 同 6 4 日 6 4 日 6

Motivations - What we know

The 20th century thought us a few good lessons:

- 1) Interactions \longrightarrow quantum field theory on **flat spacetime**:
 - it works almost perfectly for free and electroweak forces,
 - perturbative QFT, renormalization, etc...
- 2) Gravitational interaction \longrightarrow General Relativity.

3) Algebraic approach, \longrightarrow also allows for a rigorous discussion of QFT on curved backgrounds [Brunetti, Dimock, Fredenhagen, Hollands, Kay, Verch, Wald,...]

Natural playground \longrightarrow Cosmology

- unveils the structure and dynamics of the Universe,
- we can fully use QFT on curved background in the algebraic approach.

・ロト ・ 同ト ・ ヨト ・ ヨト ・

The Cosmological Principle and FRW - I

We wish to model the geometry of the Universe!

Occam's razor leads to the Cosmological principle, *i.e.*,

- $\bullet\,$ spacetime is homogeneous \to at each instant of time, all space points look the same,
- $\bullet\,$ spacetime is isotropic $\to\,$ there is at each point an observer who sees an isotropic Universe.

This entails

$$ds^2 = -dt^2 + a^2(t)\left[rac{dr^2}{1+kr^2} + r^2(d heta^2 + \sin^2 heta darphi^2)
ight].$$

- the parameter $k = 0, \pm 1$ tells me if spatial section are flat planes, spheres or hyperbolas,
- there is still no dynamical content. This determines a(t) and, to this avail, one needs a good $T_{\mu\nu}$, to solve

$$R_{\mu\nu} - \frac{R}{2}g_{\mu\nu} + \Lambda g_{\mu\nu} = 8\pi T_{\mu\nu}.$$

The Cosmological Principle and FRW - II

Which $T_{\mu\nu}$? Let us start with *classical matter*

We know:

- part of mass-energy in the Universe is ordinary matter (stars, galaxies, clusters),
- ${\ensuremath{\bullet}}$ their density is so low that they appear like "dust" with density $\rho.$ Hence

$$T_{\mu\nu} = \rho \zeta_{\mu} \zeta_{\nu} \quad \zeta^{\mu} \zeta_{\mu} = 1$$

• if we also include a contribution from pressure, then

$$T_{\mu\nu} = \rho \zeta_{\mu} \zeta_{\nu} + P \left(g_{\mu\nu} + \zeta_{\mu} \zeta_{\nu} \right),$$

which is the stress-energy tensor of a **perfect fluid**. This is the the most general choice for $T_{\mu\nu}$ if the matter is classical.

(4月) イヨト イヨト

Dynamics of the scale factor

Dynamics is encoded in Einstein's equations

1

$$R_{\mu
u}-rac{R}{2}g_{\mu
u}+\Lambda g_{\mu
u}=8\pi\,T_{\mu
u}.$$

I assume from now on $\Lambda = 0!$

$$G_{tt} = R_{tt} - \frac{R}{2}g_{tt} = 8\pi T_{tt} \longrightarrow 3\frac{\dot{a}^2 + k}{a^2} = 8\pi\rho,$$

$$G_{xx} = R_{xx} - \frac{R}{2}g_{xx} = 8\pi T_{xx} \longrightarrow 3\frac{\ddot{a}}{a^2} = -4\pi(\rho + 3P).$$

Conservation of $T_{\mu\nu}$, *i.e.*, $\nabla^{\mu}T_{\mu\nu} = 0$ yields

$$\dot{\rho} + 3(\rho + P)\frac{\dot{a}}{a} = 0$$

Notice that the dynamical content boils down to this last equation and to an identity between traces:

$$Tr(G_{\mu\nu}) = -R = 8\pi Tr(T_{\mu\nu}).$$

伺 ト イヨト イヨト

Dynamics of the scale factor - II

To solve that system we need an equation of state $\rho = \gamma P$

We assume from now on k = 0, but only for simplicity of the talk!

Eq. of state	scale factor	conservation of $T_{\mu u}$
Dust, $P = 0$	$a(t) \propto t^{rac{2}{3}}$	$ \rho a^3(t) = const. $
Radiation, $P = \frac{\rho}{3}$	a(t) $\propto \sqrt{t}$	$\rho a^4(t) = const.$

One should interpret the results, but instead let us look at the assumptions.

To get here we assumed

- isotropy and homogeneity of the Universe,
- 2 the behaviour of the stress-energy tensor is classical,
- **③** pressure and energy density are related by an equation of state.

Are we happy?

くほし くほし くほし

Practical and Foundational Problems

The "classical" approach to cosmology is highly unsatisfactory

on a practical ground,

- the model is far too rough in the description of matter,
- it is plagued by many problems, namely
 - **(**) the singularity problem as $a \rightarrow 0$, namely $\rho \rightarrow \infty$,
 - 2 the flatness problem,
 - the homogeneity problem.

and a foundational ground,

• Classical matter cannot account for an explanation of interac. as QFT.

(4月) (4日) (4日)

What we would like to know

The quest to solve those problems prompted

- Modern Cosmology \longrightarrow matter is often modelled by a scalar field.
- Bright side
 - 1 it takes seriously the role of QFT as the natural playground to discuss (quantum) matter and interactions.
 - 2 it provides a nice exit to most of the problems of standard cosmology,
 - Image: Market temperature of CMB in particular.

Dark side

- still plenty of open problems (dark matter, dark energy...),
 - It is unclear how to derive these models from "first principles".

unclear concepts in curved backgrounds:(temperature, termal equilibrium)...

・ロト ・同ト ・ヨト ・ヨト

The main question

Can we explain any of the unclear phenomena just with a rigorous analysis?

Do we really need new models or, in some cases, what we have is enough?

Let us investigate dark energy 1 \rightarrow semiclassical Einstein's equations!

The framework

Let us look at our ingredients:

• We fix the background as a FRW spacetime with flat spatial section

$$ds^2 = -dt^2 + a^2(t)[dr^2 + r^2(d\theta^2 + \sin^2\theta d\varphi^2)], \quad M \equiv \mathbb{R} \times \mathbb{R}^3$$

• we consider for "simplicity of the talk" a scalar field on M

$$P\phi(x) \doteq \left(\Box_g - \frac{R}{6} - m^2\right)\phi(x) = 0,$$

which is conformally coupled to scalar curvature.

• we shall seek solutions of $G_{\mu\nu} = 8\pi \langle : T_{\mu\nu} : \rangle_{\omega}, \longrightarrow$ in FRW

$$-R = 8\pi \langle :T: \rangle_{\omega}.$$

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

Intermezzo: the quest for an Hadamard state

What is a good choice for ω ?

A physically reasonable choice is

- **1** an ω which is quasi-free (technical condition),
- 2) an ω which is of Hadamard form,
 - same ultraviolet behaviour as the ground state in Minkowski,
 - only on these states the quantum fluctuations of $T_{\mu\nu}$ are finite.

Hence in a geodesic normal neighbourhood of any point $p \in \mathbb{R} \times \mathbb{R}^3$, the integral kernel of the two-point function is

$$\omega(x,y) = \frac{U(x,y)}{\sigma_{\epsilon}(x,y)} + V(x,y) \ln \frac{\sigma_{\epsilon}(x,y)}{\lambda} + W(x,y).$$

▶ < □ ▶ < □</p>

Intermezzo - II

Let start again from

$$\omega(x,y) = \frac{U(x,y)}{\sigma_{\epsilon}(x,y)} + V(x,y) \ln \frac{\sigma_{\epsilon}(x,y)}{\lambda} + W(x,y).$$

One can prove that

- U, V, W are all smooth scalar functions,
- in Minkowski U = 1 and $V = \frac{m^2}{2\sqrt{m^2(x-y)^2}} J_1(\sqrt{m^2(x-y)^2})$, whereas in

curved backgrounds they are a series

$$U(x,y) = \sum_{n=0}^{\infty} u_n(x,y)\sigma^n, \quad V(x,y) = \sum_{n=0}^{\infty} v_n(x,y)\sigma^n,$$

determined out of recursion relations.

- the singular part, namely U and V, depends only on geometric quantities such as $R, R^2, R_{\mu\nu}R^{\mu\nu}...$
- the choice of a quantum state of Hadamard form lies only in W.

On the stress-energy tensor

Let us assume there exists an Hadamard state!

The classical stress-energy tensor can be written as

$${\cal T}_{\mu
u}=
abla_{\mu}\phi(x)
abla_{
u}\phi(x)-rac{1}{2}g_{\mu
u}
abla_{
ho}\phi(x)
abla^{
ho}\phi(x)+\left(rac{1}{6}G_{\mu
u}+g_{\mu
u}\Box-
abla_{\mu}
abla_{
u}
ight)\phi^{2}(x).$$

- It is conserved $\longrightarrow \nabla^{\mu} T_{\mu\nu} = 0$,
- for m = 0 and $\zeta = \frac{1}{6}$ it is traceless T = 0.

Conservation is also required for consistency with Einstein's equations since

$$\nabla^{\mu}G_{\mu\nu}=0.$$

Does it hold also at a quantum level?

- 4 同 6 4 日 6 4 日 6

The quantum stress-energy tensor - I

Semiclassical Einstein's equations are

$$G_{\mu\nu} = 8\pi\langle: T_{\mu\nu}:\rangle_{\omega},$$

hence the left hand side is still conserved. This implies

 $\nabla^{\mu}\langle:T_{\mu\nu}:\rangle_{\omega}$, but is it true?

• The answer is no! The expectation value becomes proportional to terms as

$$\langle : \phi P \phi : \rangle_{\omega} \propto [v]_1 \doteq v_1(x, x), \quad \langle : (\nabla^{\mu} \phi) P \phi : \rangle_{\omega} \propto \nabla^{\mu} [v]_1,$$

A way out: exploit a freedom in the definition of $T_{\mu\nu}$.

・ 戸 ト ・ ヨ ト ・ ヨ ト

The quantum stress-energy tensor - II

Let us introduce the modified stress-energy tensor

$$T^{\eta}_{\mu
u}(x) = T_{\mu
u}(x) + \eta g_{\mu
u}(x)\phi(x)P\phi(x) \quad \eta \in \mathbb{R},$$

where $P = \Box_g - \frac{R}{6} - m^2$.

- the new term is dynamically sterile, *i.e.*, it vanishes on shell.
- the new term is conserved and traceless on shell,
- the new term gives rise to a non vanishing contribution at a quantum level,

$$\nabla^{\mu} \langle : \phi P \phi : \rangle_{\omega} \neq 0.$$

Theorem:² If ω is an Hadamard state, then, if and only if $\eta = \frac{1}{3}$, it holds

$$\nabla^{\mu}\langle : T_{\mu\nu} : \rangle_{\omega} = 0.$$

²V. Moretti: Commun. Math. Phys. 232 (2003) 189 $\rightarrow \langle \overline{\sigma} \rangle \langle \overline{z} \rangle \langle \overline{z} \rangle$

The trace anomaly

In order to have a conserved $T_{\mu\nu}$, there is a price to pay!

$$\langle :T:
angle_{\omega} = -m^2rac{W(x,x)}{8\pi^2} + rac{v_1(x,x)}{4\pi^2},$$

 $v_1(x,x) = rac{1}{720}(R_{ij}R^{ij} - rac{R^2}{3} + \Box R) + rac{m^4}{8}.$

This is the so-called conformal anomaly!

• it contains a term proportional to $\Box R \rightarrow$ dynamically unstable.

We can use a remaining freedom: add to $T_{\mu\nu}$ conserved tensors $t_{\mu\nu}$ built out of curvature invariants:

$$t_{\mu
u} = rac{\delta}{\delta g_{\mu
u}} \int\limits_{M} d^4x \sqrt{|g|} (CR^2 + DR_{\mu
u}R^{\mu
u}).$$

• Their trace $t^{\mu}_{\mu} \propto \Box R$ (it recalls f(R) theories).

(a)

э

A semiclassical effect

Let us plug the trace anomaly in

$$-R = 8\pi\langle : T : \rangle_{\omega}.$$

Let us shake the equations a little bit and we end up with

$$-6\left(\dot{H}+2H^2\right) = -8\pi m^2 \langle :\phi^2:\rangle_\omega + \frac{1}{\pi}\left(-\frac{1}{30}(\dot{H}H^2 + H^4 + \frac{m^4}{4}\right),$$
 where $H = \frac{\dot{a}(t)}{a(t)}$.

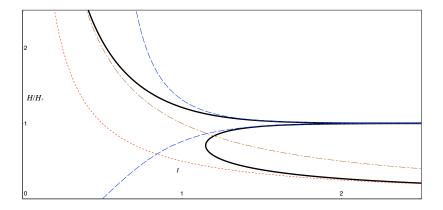

A notion of approximate ground state exists (WKB approximation):

$$m^2 \gg R \text{ and } m^2 \gg H^2 \longrightarrow \langle : \phi^2 : \rangle_\omega = rac{1}{32\pi^2}m^2 + \beta R. \quad \beta \in \mathbb{R}$$

This yields

$$\dot{H} = \frac{-H^4 + H_+^2 H^2}{H^2 - \frac{H_+^2}{4}}, \quad H_+^2 = 360\pi - 2880\pi^2 m^2 \beta.$$

A semiclassical effect - II

Is the result robust enough?

One should doubt what I told you!

- Does an Hadamard state really exist on a FRW spacetime?
- What happens with other kind of fields?

Let us look at this second problem! Notice that

- Fermionic fields might behave in a really different way,
- the result is ultimately tied to the existence and to the form of the conformal anomaly.

Our goal: calculate the anomaly for Dirac fields³.

³C. D., T. P. Hack and N. Pinamonti, arXiv:0904.0612 [math-ph]. < ≥ > ≥ ∽ ९९

Basic Geometric Structures

We shall work here in any 4D globally hyperbolic spacetime!

The following structures are necessary and well-defined

• the spin group Spin(3,1) as

$$\{e\} \longrightarrow \mathbb{Z}_2 \longrightarrow Spin(3,1) \longrightarrow SO(3,1) \longrightarrow \{e\},\$$

• the frame bundle, over *M* endowed with a non degenerate metric

 $S(M) \doteq S(M)[Spin(3,1), \tilde{\pi}, M] \quad \tilde{\pi}: S(M) \rightarrow M,$

with a bundle hom. $\rho: S(M) \rightarrow F(M)[SO(3,1),\pi',M],$

• the Dirac bundle is an associated bundle

$$DM \doteq S(M) \times_T \mathbb{C}^4$$
, $D^*M \doteq S(M) \times_T (\mathbb{C}^4)^*$

out of the repr. $T \doteq D^{\left(\frac{1}{2},0\right)} \oplus D^{\left(0,\frac{1}{2}\right)}$ of $Spin_0(3,1) \sim SL(2,\mathbb{C})$ on \mathbb{C}^4 .

Classical Dynamic - I

Kinematical configurations: A Dirac spinor and a cospinor is

$$\psi \in \Gamma(DM), \quad \psi^{\dagger} \in \Gamma(D^*M).$$

 \bullet All space and time oriented 4D globally hyperbolic spacetimes admit a spin structure

The Dirac (and the dual) bundle trivializes and hence

$$\psi: \boldsymbol{M} \longrightarrow \mathbb{C}^{4} \quad \psi^{\dagger}: \boldsymbol{M} \longrightarrow \mathbb{C}^{4}.$$

• Next ingredient are γ -matrices, the building block of the algebra of Spin(3, 1),

$$\{\gamma_{\mu},\gamma_{\nu}\}=2g_{\mu\nu},$$

- 4 同 6 4 日 6 4 日 6

Classical Dynamic - II

• Natural covariant derivative ∇ on *DM* as a pull-back from that on T(M),

$$\nabla: \Gamma(DM) \to \Gamma(DM \otimes T^*(M)).$$

- It is remarkable $\nabla \gamma = \mathbf{0}$,
- we call dynamically allowed a (co)spinor such that

$$(-\gamma^{\mu}\nabla_{\mu}+m)\psi=0, \quad (\gamma^{\mu}\nabla_{\mu}+m)\psi^{\dagger}=0,$$

- $D = -\gamma^{\mu} \nabla_{\mu} + m$ is the Dirac operator,
- $D' = \gamma^{\mu} \nabla_{\mu} + m$ is the **dual Dirac operator**.

• since $DD' = D'D = -\Box + \frac{R}{4} + m^2$ then

$$\begin{cases} D\psi = 0, \longrightarrow (-\Box + \frac{R}{4} + m^2)\psi = 0\\ D'\psi^{\dagger} = 0 \longrightarrow (-\Box + \frac{R}{4} + m^2)\psi^{\dagger} = 0 \end{cases}$$

.

・ 同 ト ・ ヨ ト ・ ヨ ト

From Classical to Quantum Stress-Energy Tensor

The classical stress-energy tensor is

$$T_{\mu\nu} = rac{1}{2} \left(\psi^{\dagger} \gamma_{(\mu} \psi_{;\nu)} - \psi^{\dagger}_{(;\mu} \gamma_{\nu)} \psi
ight) - rac{1}{2} \mathcal{L}[\psi] g_{\mu\nu}.$$

• Dirac equation entails

$$\nabla^{\mu} T_{\mu\nu} = 0 \quad T = g^{\mu\nu} T_{\mu\nu} = -m\psi^{\dagger}\psi.$$

- We are interested in $\langle : T_{\mu\nu} : \rangle_{\omega}$ with an Hadamard state ω .
 - point-splitting along a geodesic

$${\mathcal T}_{\mu
u}(x,y)\doteq rac{1}{2}\left(\psi^\dagger(x)\gamma_{(\mu}g^{
u'}_{
u)}\psi(y)_{;
u'}-\psi^\dagger(x)_{;(\mu}\gamma_{
u)}\psi(y)
ight),$$

- - E - - E

Seeking a quantum conserved $T_{\mu u}$

• Subtraction of the singularity

$$\begin{split} \omega(:T_{\mu\nu}(x):) &\doteq Tr\left[\omega(T_{\mu\nu}(x,y)) - T_{\mu\nu}^{sing}(x,y)\right]_{y=x} \\ &\doteq Tr\left[D_{\mu\nu}^0\left(\omega^-(x,y) + \frac{1}{8\pi^2}D'_yH\right)\right]_{y=x} \doteq \frac{1}{8\pi^2}Tr\left[D_{\mu\nu}W(x,y)\right]_{y=x} \end{split}$$

• Canonical but unsatisfactory choice of $D^0_{\mu
u}$, $D_{\mu
u}$

$$D^0_{\mu\nu} \doteq \frac{1}{2} \gamma_{(\mu} \left(g^{\nu'}_{\nu)} \nabla_{\nu'} - \nabla_{\nu)} \right), \qquad D_{\mu\nu} \doteq -D^0_{\mu\nu} D'_{y},$$

• Problem: $D'_{y}H(x, y)$ does not satisfy Einstein's equations

- $\langle : T_{\mu\nu} : \rangle_{\omega}$ is not conserved \rightarrow ill-posed semiclassical Einstein's equations
- we can seek for the same solution as in the scalar case
 - **1** we add to the classical $T_{\mu\nu}$ multiples of $L[\psi]g_{\mu\nu}$,
 - 2 it amounts to $D_{\mu\nu}^{mod} = D_{\mu\nu} + \frac{c}{2}g_{\mu\nu}(D'_x + D_y)D'_y$.

The Trace

Let us

- consider the described modified $T^{mod}_{\mu\nu}$,
- an Hadamard state ω ,
- a reference length $\lambda = 2 \exp(\frac{7}{2} 2\gamma)m^{-2}$ if $m \neq 0$ (arbitrary for m = 0),
- It turns out that if $c = \frac{1}{6}$
 - $\nabla^{\mu}\langle :T_{\mu\nu}:\rangle_{\omega}=0$,
 - the trace does not vanish⁴ even with m = 0 and

$$\langle : T : \rangle_{\omega} = \frac{1}{\pi^2} \left(\frac{R^2}{1152} - \frac{\Box R}{480} - \frac{R_{\mu\nu}R^{\mu\nu}}{720} - \frac{7}{5760} R_{\mu\nu\rho\delta} R^{\mu\nu\rho\delta} \right)$$

• We have the same structure of the conformal anomaly as for the scalar case!

⁴We admit abuses of Ph.D. students in the realization of this project and the students of th

Conclusions

Hurdled Problems

- it is possible to tackle cosmological problems with the language of AQFT,
- this approach shows
 - the existence of late time stable solutions for the semiclassical Einstein's equations,
 - elarification of the origin of the conformal anomaly for Dirac fields,
 - It identification of a distinguished ground state for free scalar field theories on certain FRW spacetimes (next talk).

Problems yet to hurdle

- identify a good notion of termal equilibrium at least in FRW spacetimes (using N. Pinamonti, 0806.0803 to appear on CMP),
- create a valuable companion tool of experiment with the aim to rule out the pathological cosmological models,
- understand the role of quantum effects for all kind of fields in phenomena such as dark matter, dark energy, baryogenesis ...
